

## WEB application for consulting meteorological data

PULSOWEB is a WEB application for consulting meteorological data:

- Access a local or remote database hosted in a cloud and view the data in graph, table or map format
- Configure and customize the graphical interface for each user. Each user has a "user name" and a "password" to log in
- Pre-code a SYNOP BUFR or METAR weather message for an observer
- Enter manual observations to complete the meteorological message (Visibility, cloud height...)
- Automatically adapt the display to the terminal you are using (smartphone, tablet or PC)
